Summary

This report presents the pressure distribution and integrated aerodynamic coefficient data for a NASA SC(2)-0714 airfoil at Mach numbers from 0.60 to 0.76 and angles of attack from -2.0° to 6.0° . The test Reynolds numbers were 4×10^6 , 6×10^6 , 10×10^6 , 15×10^6 , 30×10^6 , 40×10^6 , and 45×10^6 , based on the 152.4-mm chord of the airfoil. The pressure distributions and aerodynamic coefficients are presented in graphic and tabular forms without analysis.

Introduction

As part of the Advanced Technology Airfoil Tests (ATAT) program (see ref. 1), the NASA SC(2)-0714 airfoil was tested in the Langley 0.3-Meter Transonic Cryogenic Tunnel (0.3-m TCT). The SC(2)-0714 is a 14-percent-thick airfoil having a design normal-force coefficient of 0.70 at a Reynolds number of 40×10^6 . The airfoil was tested at Mach numbers from 0.60 to 0.76 and angles of attack from -2.0° to 6.0° . The test Reynolds numbers were 4×10^6 , 6×10^6 , 10×10^6 , 15×10^6 , 30×10^6 , 40×10^6 , and 45×10^6 , based on the 152.4-mm chord of the airfoil. The basic data, consisting of surface pressure distributions and integrated aerodynamic coefficients, are presented herein. Trends are discussed, but comparisons with other data are not included.

Symbols

Values are usually given in SI units but, where considered useful or expedient, they are also given in U.S. Customary Units. Measurements and calculations were made in U.S. Customary Units. The symbols in parentheses are those used on computer-generated plots and tables in the appendixes.

Apparatus

Wind Tunnel

Tests of the NASA SC(2)-0714 airfoil were conducted in the 8- by 24-in. two-dimensional test section of the Langley 0.3-m TCT. The 0.3-m TCT is a continuous-flow, fan-driven, transonic tunnel that uses nitrogen gas as the test medium. The tunnel is capable of operating at stagnation temperatures varying from about 78 K to about 327 K and stagnation pressures ranging from slightly greater than 1 atm up to 6 atm (where 1 atm = 14.7 psi). Mach number can be varied from about 0.20 to 0.90. The ability to operate at cryogenic temperatures combined with the pressure capability of 6 atm provides a high Reynolds number capability at relatively low model loading. For this test, slotted walls were installed for the floor and ceiling to help reduce model blockage. Information on the design and operational capabilities of the 0.3-m TCT can be found in references 2 and 3. The use of cryogenic nitrogen as a test gas is discussed in reference 4. Discussions of the data acquisition system and data reduction technique for the 0.3-m TCT are given in references 5 and 6. Repeatability of the data is discussed in reference 7.

The test section for two-dimensional tests contains computer-driven angle-of-attack and wake survey (momentum) rake systems. The angle-of-attack system is capable of varying the angle of attack over a range of about 40° . The momentum rake (see fig. 1), located just downstream of the airfoil (see

fig. 2), provides up to nine total-pressure measurements across the span of the model and can traverse vertically from about 1 chord above to about $1/2$ chord below the model. Integration of these pressure measurements provides the wake drag force coefficient. The comparison of these spanwise pressure measurements provides a mechanism for determining the extent of the two-dimensionality in the flow. Sidewall boundary-layer suction was not used for the present tests.

Model

The NASA SC(2)-0714 airfoil was designed at the Langley Research Center. This airfoil is of the supercritical type and has a maximum thickness-to-chord ratio of 0.14 with a blunt trailing edge of 0.0077-chord thickness. The original airfoil was not blunt but had a recess slot cut in the upper-surface trailing edge. The airfoil shape and pressure orifice layout are given in figure 3. The orifice layout is given as a planform of the model viewed from above while facing into the flow.

The model tested has a chord of 152.4 mm (6.0 in.) and was constructed of Armco PH 13-8 Mo stainless steel. The model was fabricated in two parts and these parts were bonded together with a structural adhesive film. The surface pressure tubing was placed inside the model by trenching the joining surfaces before the two parts were bonded. The static pressure orifices were made by drilling 0.254-mm-diameter (0.010-in.) holes normal to the model surface to meet the internal tubes. The model was designed to have 24 static pressure orifices on the upper surface and 24 orifices on the lower surface. However, only 22 orifices on the upper surface and 23 on the lower surface were suitable for use in the tests. In addition, there were 18 spanwise orifices on the upper surface.

The model contour was not within the desired tolerance of $0.0002c$ of the design values of the SC(2)-0714 coordinates. The upper surface was thinner than the design values. In fact, the first 2 percent was thinner by as much as $0.0013c$. The lower surface was generally thinner than the design values with excursions as great as $0.0015c$ within the first 2 percent of chord. The total contour of the model was smooth and continuous with a surface finish in the range from 0.102 to $0.2 \mu\text{m}$ (4 to 8 $\mu\text{in.}$). Both the design and the measured coordinates for the model are given in table I, and the orifice locations are given in table II.

Wake Rake

As previously mentioned, the airfoil drag force coefficient is determined using the wake rake shown

in figure 1. For the present tests, the rake contained six active pitot tubes. Pitot tube 1 (the preferred measurement $\eta = 0.0$) was on the tunnel midspan. Pitot tube 2 was located 12.7 mm ($\eta = -0.125$) to the left of the tunnel midspan; tube 3 was 25.4 mm ($\eta = -0.250$) to the left of the tunnel midspan; tube 4 was 38.1 mm ($\eta = -0.375$) to the left of the tunnel midspan; tube 5 was 50.8 mm ($\eta = -0.500$) to the left of the tunnel midspan; and tube 6 was 76.2 mm ($\eta = -0.750$) to the left of the tunnel midspan. The tubes had an outside diameter of 1.52 mm (0.060 in.) and an inside diameter of 1.02 mm (0.040 in.). Nine static pressures were measured on the sidewall opposite the wake rake. The nine static pressure orifices are arranged with one orifice midway between the tunnel floor and ceiling and four each spaced 25.4 mm apart above and below this midpoint. Both the pitot and static pressure measurements were made in a plane located about 183 mm (1.2c) downstream of the model trailing edge.

Data Reduction

Section normal-force and quarter-chord pitching-moment coefficients are obtained through the numerical integrations of the surface pressure distributions. The local pressure measured at each orifice is multiplied by the incremental area over which that pressure acts to form the force distribution functions. The force distribution functions are integrated by the trapezoidal method.

Section profile-drag coefficient is obtained from the rake pitot pressure measurements by computing the point drag coefficient by the method of reference 8 for each of the rake pitot tubes and rake position. These point drag coefficients are numerically integrated over the wake by the trapezoidal method. These integrated values are given in the computer-tabulated data as CD1 through CD6. The point drag coefficients are calculated under the assumption of zero pressure decrement outside the model wake, and they are corrected by applying the nonzero decrement correction during the integration. This correction is accomplished by comparing a "threshold" value to the individual point drag coefficients. If the point drag values are greater than or equal to the threshold, they are included in the integration; otherwise they are excluded. This procedure corrects only the extent of the wake over which the integration occurs. The area between threshold value and zero (which is bounded by the extent of the wake) is subtracted from CD1 through CD6 to obtain CDCOR1 through CDCOR6, which are thus corrected for both the extent of the wake and the nonzero pressure decrement outside the wake. The corrected value

of section profile-drag coefficient (CDCOR) is the section profile-drag coefficient c_d . For the present test, the threshold value was arbitrarily set at 0.0002 based on previous experience. The integration procedure compares the threshold value against the actual computed point drag values to assure that the assigned value is appropriate for each individual rake tube. If the assigned threshold value is not appropriate, the procedure chooses a computed point drag value that minimizes the error in the integration.

Presentation of Data

The data were taken over a Mach number range from 0.60 to 0.76 and an angle-of-attack range from -2.0° to 6.0° . The test Reynolds numbers were 4×10^6 , 6×10^6 , 10×10^6 , 15×10^6 , 30×10^6 , 40×10^6 , and 45×10^6 , based on the 152.4-mm (6.0-in.) model chord.

The experimental data for the SC(2)-0714 airfoil are presented without corrections for wall interference effects. The tables of reference 9 can be used to correct the data for the presence of sidewalls only, or the correction procedure of either reference 10 or reference 11 can be used to correct for the presence of all four walls. The surface pressure data are presented in graphic and tabular forms in appendixes A through J. Each appendix presents a particular Mach number. The data are plotted for each angle of attack for a given Mach number and Reynolds number combination. The remaining data are presented in the figures in the following order.

Figure

$M = 0.735$	6(g)
$M = 0.74$	6(h)
$M = 0.75$	6(i)
$M = 0.76$	6(j)

Discussion of Data

Effects of Reynolds Number

The section characteristics obtained at various Reynolds numbers are given for fixed Mach numbers in figure 4. (The single data curve at $M = 0.735$ (fig. 4(g)) is included for data completeness.) The general trends observed in this figure are that normal-force coefficient increases slightly with increasing Reynolds number at a given angle of attack. Section profile-drag coefficient decreases with increasing Reynolds number. The nose-down quarter-chord pitching-moment coefficient becomes slightly more negative with increasing Reynolds number. These general trends are violated by the lower Reynolds number (4×10^6 and 6×10^6) curves, which are probably affected by various amounts of laminar flow on the airfoil. The tunnel turbulence level at the higher Reynolds number is probably sufficient to cause transition well forward on the airfoil.

Effects of Mach Number

The section characteristics at various Mach numbers are given for fixed Reynolds numbers in figure 5. Several general trends are observed in this figure. For example, the section profile-drag coefficient and the slope of the normal-force coefficient increase with an increase in Mach number, and quarter-chord pitching-moment coefficient becomes more negative as Mach number increases.

Spanwise Distribution of Profile Drag

The profile-drag coefficients derived from the six wake rake pitot tubes are given in figure 6 for the design Reynolds number of 40×10^6 at various free-stream Mach numbers. These drag measurements across the tunnel provide an indication of the two-dimensionality of the flow in the tunnel. Ideally, the flow should be two-dimensional across the full span of the model. The juncture of the model and sidewall is three-dimensional, and two-dimensional flow is not possible at the juncture. The profile-drag coefficient obtained at $\eta = -0.750$ for the majority of Mach numbers and normal-force coefficients indicates that the three-dimensional juncture flow extended from the wall to this location. The other profile-drag values indicate that the center half of the model has two-dimensional flow for Mach numbers up to 0.74 and normal-force coefficients up to at least the design value of 0.70. The cases for $M = 0.75$ and 0.76 appear to have a small gradient in profile drag over the span of the model for most values of the normal-force coefficient.

Concluding Remarks

A NASA SC(2)-0714 airfoil model with a 152.4-mm chord was tested in the Langley 0.3-Meter Transonic Cryogenic Tunnel. This airfoil is 14 percent thick with a design normal-force coefficient of 0.70. The airfoil was tested at Mach numbers from 0.60 to 0.76 and angles of attack from -2.0° to 6.0° . The test Reynolds numbers were 4×10^6 , 6×10^6 , 10×10^6 , 15×10^6 , 30×10^6 , 40×10^6 , and 45×10^6 . The pressure distributions and integrated aerodynamic coefficients are presented in graphic form. Several general trends for the integrated aerodynamic data were observed. For example, increasing Reynolds number or Mach number results in a more negative nose-down pitching-moment coefficient. Normal-force coefficient increases slightly with increasing Reynolds number, whereas normal-force slope increases slightly with increasing Mach number. The section profile-drag coefficient decreases with increasing Reynolds number except for the 4×10^6 and 6×10^6 cases. Increasing the Mach number increases the profile-drag coefficient.

Appendices

The pressure data for the NASA SC(2)-0714 airfoil are presented in plotted and tabulated formats in appendixes A through J. Each appendix contains data for a given Mach number at the Reynolds numbers tested for that particular Mach number. For each combination of Mach number and Reynolds number, the data are plotted for each angle of attack (given in degrees) with the associated tabulated data immediately following the plotted data. The pressure data for the upper surface of the airfoil are plotted as open symbols, and the lower-surface data are plotted as solid symbols. The following list indicates the parameters for each appendix:

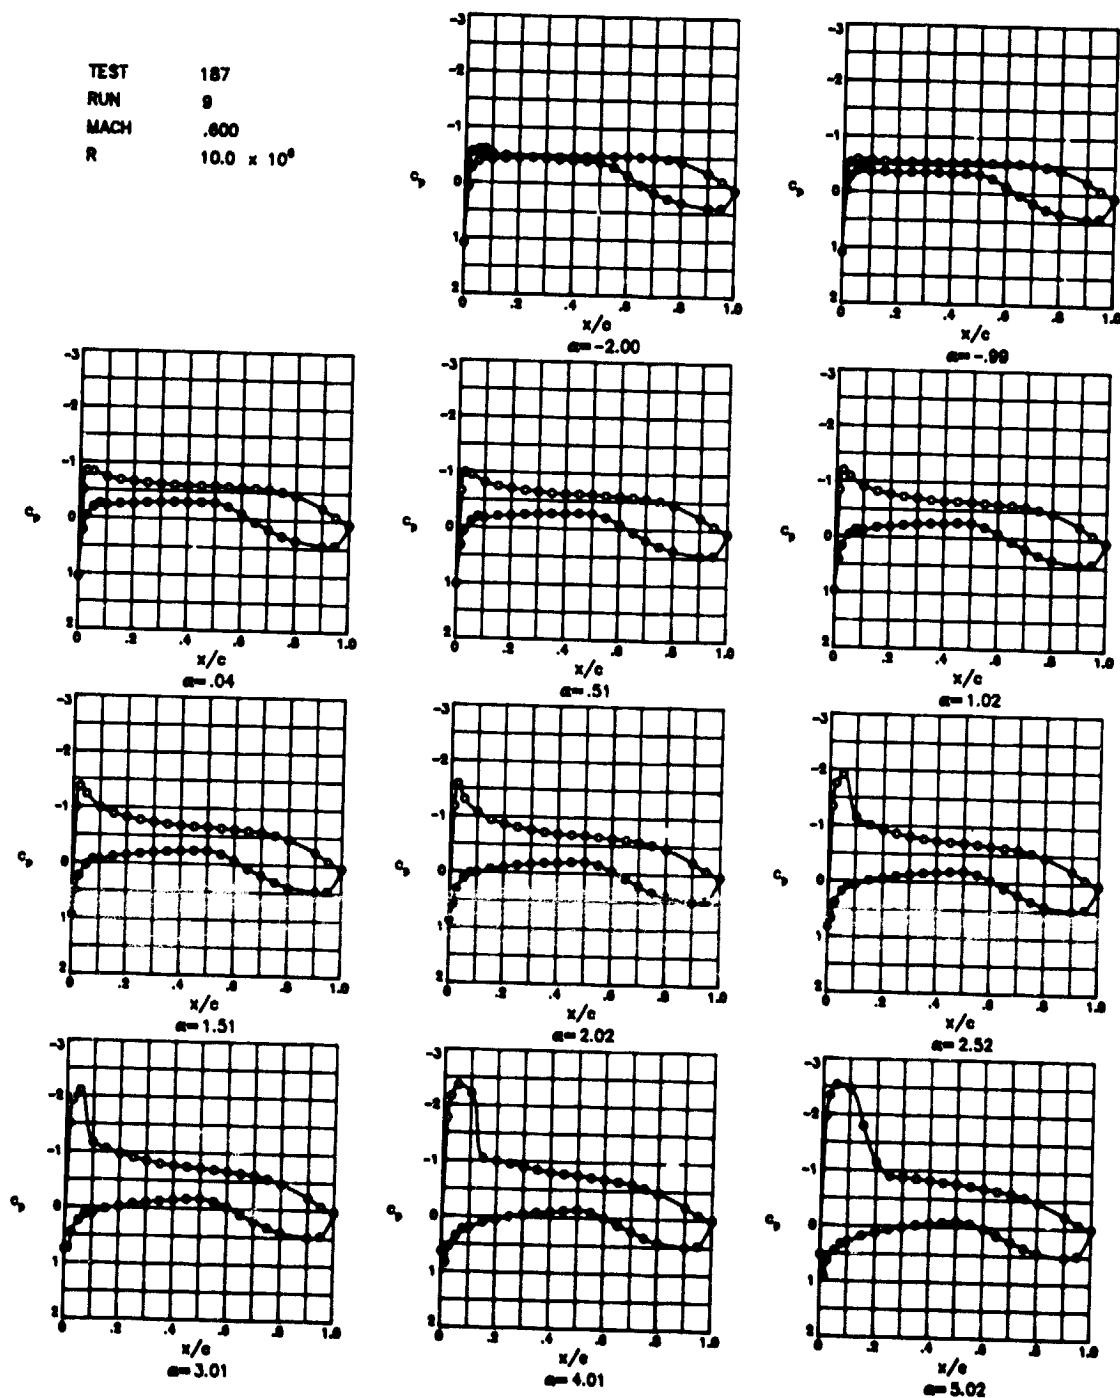

Appendix	Mach number	Reynolds number ($\times 10^{-6}$)	Page
A	0.60	10.0, 30.0, 40.0	6
B	0.65	10.0, 15.0, 30.0, 40.0, 45.0	22
C	0.70	4.0, 6.0, 10.0, 15.0, 30.0, 40.0, 45.0	43
D	0.71	4.0, 6.0, 10.0, 15.0, 30.0, 40.0, 45.0	84
E	0.72	4.0, 6.0, 10.0, 15.0, 30.0, 40.0, 45.0	118
F	0.73	4.0, 6.0, 10.0, 15.0, 30.0, 40.0, 45.0	154
G	0.735	40.0	189
H	0.74	4.0, 6.0, 10.0, 15.0, 30.0, 40.0, 45.0	193
I	0.75	4.0, 6.0, 10.0, 15.0, 30.0, 40.0	227
J	0.76	10.0, 40.0	250

Appendix A

Pressure Data for $M = 0.60$; $R = 10 \times 10^6$, 30×10^6 , and 40×10^6

The pressure measurements made on the NASA SC(2)-0714 airfoil are presented in coefficient form in graphs and tables in this appendix. The data are given for a Mach number and the associated Reynolds number range. The pressure data for the upper surface of the airfoil are plotted as open symbols, and the lower-surface data are plotted as solid symbols.

Appendix B

Pressure Data for $M = 0.65$; $R = 10 \times 10^6$, 15×10^6 , 30×10^6 , 40×10^6 , and 45×10^6

The pressure measurements made on the NASA SC(2)-0714 airfoil are presented in coefficient form in graphs and tables in this appendix. The data are given for a Mach number and the associated Reynolds number range. The pressure data for the upper surface of the airfoil are plotted as open symbols, and the lower-surface data are plotted as solid symbols.

Appendix C

Pressure Data for $M = 0.70$; $R = 4 \times 10^6, 6 \times 10^6, 10 \times 10^6, 15 \times 10^6, 30 \times 10^6, 40 \times 10^6$, and 45×10^6

The pressure measurements made on the NASA SC(2)-0714 airfoil are presented in coefficient form in graphs and tables in this appendix. The data are given for a Mach number and the associated Reynolds number range. The pressure data for the upper surface of the airfoil are plotted as open symbols, and the lower-surface data are plotted as solid symbols.

Appendix D

Pressure Data for $M = 0.71$; $R = 4 \times 10^6, 6 \times 10^6, 10 \times 10^6, 15 \times 10^6, 30 \times 10^6, 40 \times 10^6$, and 45×10^6

The pressure measurements made on the NASA SC(2)-0714 airfoil are presented in coefficient form in graphs and tables in this appendix. The data are given for a Mach number and the associated Reynolds number range. The pressure data for the upper surface of the airfoil are plotted as open symbols, and the lower-surface data are plotted as solid symbols.

Appendix E

Pressure Data for $M = 0.72$; $R = 4 \times 10^6, 6 \times 10^6, 10 \times 10^6, 15 \times 10^6, 30 \times 10^6, 40 \times 10^6$, and 45×10^6

The pressure measurements made on the NASA SC(2)-0714 airfoil are presented in coefficient form in graphs and tables in this appendix. The data are given for a Mach number and the associated Reynolds number range. The pressure data for the upper surface of the airfoil are plotted as open symbols, and the lower-surface data are plotted as solid symbols.

Appendix F

Pressure Data for $M = 0.73$; $R = 4 \times 10^6, 6 \times 10^6, 10 \times 10^6, 15 \times 10^6, 30 \times 10^6, 40 \times 10^6$, and 45×10^6

The pressure measurements made on the NASA SC(2)-0714 airfoil are presented in coefficient form in graphs and tables in this appendix. The data are given for a Mach number and the associated Reynolds number range. The pressure data for the upper surface of the airfoil are plotted as open symbols, and the lower-surface data are plotted as solid symbols.

Appendix G

Pressure Data for $M = 0.735$; $R = 40 \times 10^6$

The pressure measurements made on the NASA SC(2)-0714 airfoil are presented in coefficient form in graphs and tables in this appendix. The data are given for a Mach number and the associated Reynolds number range. The pressure data for the upper surface of the airfoil are plotted as open symbols, and the lower-surface data are plotted with solid symbols.

Appendix H

Pressure Data for $M = 0.74$; $R = 4 \times 10^6, 6 \times 10^6, 10 \times 10^6, 15 \times 10^6, 30 \times 10^6, 40 \times 10^6$, and 45×10^6

The pressure measurements made on the NASA SC(2)-0714 airfoil are presented in coefficient form in graphs and tables in this appendix. The data are given for a Mach number and the associated Reynolds number range. The pressure data for the upper surface of the airfoil are plotted as open symbols, and the lower-surface data are plotted as solid symbols.

Appendix I

Pressure Data for $M = 0.75$; $R = 4 \times 10^6, 6 \times 10^6, 10 \times 10^6, 15 \times 10^6, 30 \times 10^6$, and 40×10^6

The pressure measurements made on the NASA SC(2)-0714 airfoil are presented in coefficient form in graphs and tables in this appendix. The data are given for a Mach number and the associated Reynolds number range. The pressure data for the upper surface of the airfoil are plotted as open symbols, and the lower-surface data are plotted as solid symbols.

Appendix J

Pressure Data for $M = 0.76$; $R = 10 \times 10^6$ and 40×10^6

The pressure measurements made on the NASA SC(2)-0714 airfoil are presented in coefficient form in graphs and tables in this appendix. The data are given for a Mach number and the associated Reynolds number range. The pressure data for the upper surface of the airfoil are plotted as open symbols, and the lower-surface data are plotted as solid symbols.

16. Abstract <p>This report presents in graphic and tabular forms the aerodynamic coefficient and surface pressure distribution data for a NASA SC(2)-0714 airfoil tested in the Langley 0.3-Meter Transonic Cryogenic Tunnel. This test was another in the series of tests involved in the joint NASA/U.S. industry Advanced Technology Airfoil Tests program. This 14-percent-thick supercritical airfoil was tested at Mach numbers from 0.60 to 0.76 and angles of attack from -2.0° to 6.0°. The test Reynolds numbers were 4×10^6, 6×10^6, 10×10^6, 15×10^6, 30×10^6, 40×10^6, and 45×10^6.</p>
